Education

- Sep 2020 – Jun 2026 (expected) **University of California, Los Angeles**
Los Angeles, CA
- Pursuing **Master of Science, Computer Science** (GPA: 3.8/4.0)
 - Awarded **Bachelor of Science, Computer Science and Engineering** in June 2024 (GPA: 3.8/4.0)
 - **University of California Regents Scholar**: awarded to the top 1.5% of incoming UCLA students.
 - **National Merit Scholar**: awarded to the top 0.5% of eligible college-bound students in the U.S.
 - President of the Linux Users Group at UCLA

Work Experience

- Jan 2025 – Present **Graduate Research Assistant**
Misinformation, AI & Responsible Society (MARS) Lab, UCLA
- **X-Teaming**: First author on paper accepted to COLM 2025. Developed robust and generalizable black-box multi-turn LLM jailbreaking techniques that achieve state-of-the-art performance against modern commercial and open-weight models like GPT-4o, Claude, Llama, and Gemini.
 - **AI Debate**: Fifth author on paper accepted to NeurIPS 2025. Studied the efficacy of AI-human collaboration at evaluating factuality claims in consultancy and multi-agent debate settings.
 - Upcoming projects: Process Reward Modeling with Theorem Provers; Benchmarks for Agentic Tasks.
- Oct 2020 – Present **Software Development Team Lead**
Electron Losses & Fields Investigation (ELFIN), UCLA
ELFIN is a student-run lab funded by the NSF and NASA to develop satellites for studying space weather.
- **Plasma Observatory**: Developing serial communication interface between ground support equipment and Energetic Particle Detector (EPD) instrument for upcoming ESA mission, which will study plasma energization and energy transport in the Earth's magnetospheric system.
 - **Attitude Determination and Control Systems (ADCS)**: Led a team of four students to build Attitools, a Python FastAPI service for managing attitude simulation jobs. Oversaw the complete workflow where satellite operators can curate calculated attitudes through a web application.
 - **ELFIN Mission**: Maintained core Python libraries for ground support equipment. Added support for data collection during periods when the ELFIN satellites overlapped. Optimized the data pipeline, resulting in an eightfold increase in the amount of data downloaded.
- Jun 2025 – Sep 2025 **Flight Software Intern**
Millennium Space Systems, El Segundo, CA
- Rebuilt and customized Petalinux distributions on spacecraft flight computer and mission data processor, enabling Network File System (NFS) client/server functionality, and developed corresponding flight software task to monitor mounted volumes' health and storage capacity.
 - Refactored FPGA-flight computer inter-process communication (IPC) logic to optimize time synchronization, reducing redundant packet traffic by over 50% and improving system efficiency.
- Jun 2024 – Sep 2024 **Flight Software Intern**
Millennium Space Systems, El Segundo, CA
- Developed a Vorago microcontroller bootloader for peripherals and subsystems to be included in future generations of Millennium satellites. Added Golay error detection & correction (EDAC), allowing the bootloader to fully recover from boot image errors of up to 12.5%.
 - Improved test coverage, continuous integration, and streamlined build processes across multiple flight software repositories.
- Nov 2023 – Jun 2024 **Undergraduate Research Assistant**
Complex Networks Group, UCLA
- Evaluated the generalization capabilities of **DNA-ESA**, a BERT-based LLM for DNA sequence alignment, on secondary tasks such as genome assembly and cross-species sequence alignment. Developed an autoencoder neural network to detect pathological variations in sequence data.
 - Improved identification and characterization of actors in **Generative Semantic Workspaces**, an LLM-powered memory graph to keep track of actors, roles, and states in complex narratives.

Jun 2023 – Sep 2023 **Flight Software Applications Intern**

NASA Jet Propulsion Laboratory, Pasadena, CA

- Contributed to the Vision Compute Element Flight Software (VCEFSW) of the Sample Retrieval Lander for the upcoming Mars Sample Return mission. Added commands to leverage new hardware features, including toggling SUROM write protection and managing data products on NAND flash.
- Improved existing Python tools used for integration and automated hardware-in-the-loop (HIL) testing. Refactored test scripts from the Mars 2020 mission, and improved unit test coverage in the Computer Vision Accelerator Card Driver (CVACDRV).

Jun 2022 – Sep 2022 **Software Engineering Intern**

Apton Biosystems (acquired by Pacific Biosciences), Pleasanton, CA

- Singlehandedly accelerated base calling for DNA sequencing by running a boosted trees ML model on FPGAs instead of GPUs. Integrated FPGA workers into the existing C# data pipeline, resulting in a fourfold increase in processing speed to over 40 million samples per sec.
- Designed and built a web analytics portal using JavaScript (Vue) to automatically query, correlate, and graphically present DNA sequencing data, thus eliminating a previously manual and labor-intensive process and allowing scientists to quickly analyze their experimental results.

Projects

May 2025 **Highway Analytics and Navigation Extractor (HANE)**

- A tool for analyzing POV videos of motorcycle rides using computer vision algorithms.
- Uses YOLO11 object detection model to identify regions of interest. Supports traditional optical character recognition (OCR) as well as modern vision language model (VLM) approaches to read dashboard data.
- Produces plots of motorcycle speed over time. Logs potentially important events such as other vehicles and traffic signals.

Mar 2024 **MikuAI**

- A Discord chatbot that participates in group chats as a funny, sarcastic companion. Uses a version of the Llama 3 language model fine-tuned on my own conversation data.
- Uses AI voice cloning to mimic the voice of Hatsune Miku from Crypton Future Media.

Jun 2023 **Kagamine Len Sleeve**

- Designed and built a wearable live audio spectrum visualizer using a FLORA microcontroller, microphone amplifier, and custom-built LED matrix.

2018 – 2023 **Atmos**

atmos.warplight.dev

- Developed a new social media platform inspired by Google+, using PHP (Laravel) to build the backend and JavaScript (SvelteKit) to build a single-page application (SPA) frontend.
- Scaled to accommodate over 1,900 users, 50,000 posts/comments, and 16,000 media uploads.
